Introduction

This document is a compilation of published quantitative data obtained with authentic calibrants for the concentrations of C₆–C₂ metabolites (i.e. phenylacetic acids and the associated phase-2 conjugates) in human urine, plasma, ileal fluid and feces. The originating publications were identified by searching Web of Science, PubMed and Google Scholar up to May 2024.

Data originally reported on a mass/day or mass/volume basis have been converted to a molar basis to facilitate comparisons, but some published data were excluded from these tables:

- (i) Data originally reported relative to creatinine, the standard clinical practice with spot plasma and urine samples, cannot be accurately converted to a molar basis because creatinine production varies with sex, age and protein intake.
- (ii) Data produced by acid or enzymic hydrolysis of phase-2 conjugates have not been tabulated except for glycine or glutamine conjugates when β -glucuronidase and sulfatase hydrolysis has been used.

Similar compilations have been prepared for C₆-C₁ metabolites (benzoic acids), C₆-C₃ metabolites (3-phenylpropanoic acids and cinnamic acids) and C₆-C₅ metabolites (5-phenylvaleric acids, 4-hydroxy-5-hydroxyphenylvaleric acids and phenylvalerolactones) and the metabolites have been identified using the nomenclature recommended by Kay *et al.* (Kay et al. 2020) and are numbered consecutively in a single series through the five documents.

Table 64. Phenylacetic acid and phenylacetyl-glutamine											
Free-living Plasma spot value	Feeding Study Plasma C_{max}	Feeding Study Urine	Washout				Fecal water $\mu\text{mol/l}$	Ileal fluid $\mu\text{mol/l}$	Notes	Reference	N
			Washout duration	Plasma spot conc ⁿ $\mu\text{mol/l}$	Urine collection duration	Urine content μmol					
47.2 ± 5.9 58.9 ± 3.8 50.3 ± 5.0 48.5 ± 3.8 51.6 ± 6.1									Healthy free-living adults (mean ± s.d., $N=12$). Data from HMDB supplementary data attached to the journal no longer available. ENZYME HYDROLYSED (NOT AMINO ACID CONJUGATES)	(Loke et al. 2009)	12
1.41 (0.37, 14.61)									Healthy free-living adults (Median , min, max, $N=72$)	(Beloborodova et al. 2015)	72
38.1 ± 73.0 (11.2 and 13.3)									Free-living volunteers ($N=90$, mean ± s.d.) (median and IQR)	(Le Sayec et al. 2023)	90
0.79 ± 0.45 free acid 1.17 ± 0.63 glutamine conjugate									Free-living fasting individuals ($N=28$, mean ± s.d.) BEFORE AND AFTER ACID HYDROLYSIS	(Davis, Durden, and Boulton 1982)	28
1.14 ± 0.61 free acid 0.86 ± 0.50 glutamine conjugate									Free-living non-fasting individuals ($N=10$, mean ± s.d.) BEFORE AND AFTER ACID HYDROLYSIS		14
0.343 0.243–0.453 ^e		<LOQ ^e							$N=10$, median and IQR. Polyphenol-rich breakfast for 3 days ^a	(Domínguez-Fernández et al. 2021)	10
		18 ± 4	—						Placebo 7 days (mean ± s.e., $N=20$)	(Olthof et al. 2003)	20
		20 ± 4							5-CQA 5.5 mmol/day, 7 days (mean ± s.e., $N=20$)		
		22 ± 4							660 μmol rutin/day, 7 days (mean ± s.e., $N=20$)		

		21 ± 5							4.3 mmol/d black tea solids, 7 days (mean ± s.e., 4N=20). No significant differences		
	8.3 ± 1.9	14.7 ± 6.2	Three days						Daily Cranberry juice (787 mg) for 1 month (mean ± s.e., N=10).	(Feliciano, Boeres, et al. 2016)	10
	8.11 ± 2.45		Three days						Daily Cranberry juice (476 mg) (mean ± s.e., N=10).	(Feliciano et al. 2017)	10
	7.90 ± 2.00		Three days						Daily Cranberry juice (1238 mg) for (mean ± s.e., N=10).		10
	8.05 ± 2.11		Three days						Daily Cranberry juice (1534 mg (mean ± s.e., N=10).		10
	10.35 ± 3.76		Three days						Daily Cranberry juice (1910 mg) (mean ± s.e., N=10).		10
		2.3 ± 0.37 day 1 3.15 ± 0.95 at 1 month	1-day including over-night fast	2.8 ± 1.3 2.6 ± 0.16 1.6 ± 0.6 1.1 ± 0.3					Daily Wild blueberries (726 mg) for 1 month (mean ± s.e., N=18).	(Feliciano, Istas, et al. 2016)	18
		0.8 ± 0.2 ^d	Two days		12 hours	0.7 ± 0.4 ^d			Orange juice (398 µmol) (mean ± s.e., N=10 trained)	(Pereira-Caro et al. 2017)	10
		1.5 ± 0.4 ^d	Two days		12 hours	0.4 ± 0.2 ^d			Orange juice (398 µmol) (mean ± s.e., N=10 detrained)		
		46.7 ± 10.5 day 1 64.1 ± 17.4 at 1 month	2-day including over-night fast	13.3 ± 1.5					Day 1 placebo (mean ± s.e., N=22) Placebo after 1 month (mean ± s.e., N=22)	(Heiss et al. 2022)	22
		97.5 ± 18.7 day 1 37.3 ± 10.9 at 1 month	2-day including over-night fast	12.9 ± 1.5					Day 1 cranberries (525 mg) (mean ± s.e., N=23) Cranberries (525 mg) after 1 month (mean ± s.e., N=23)		23
	19.21 ± 1.28 20.32 ± 1.20	42.77 ± 5.51 49.30 ± 7.77	overnight fast						Skimmed milk (mean ± s.e., N=42) Cocoa (248 mg) with skimmed milk (mean ± s.e., N=42) ENZYME HYDROLYSED (NOT AMINO ACID CONJUGATES)	(Urpi-Sarda et al. 2009)	42
			—				188 ± 70		Free-living volunteers (mean ± s.e., N=5)	(Karlsson et al. 2005)	5

			—				479 ± 391		Free-living volunteers (N=5) (mean ± s.d.). No increase on hydrolysis	(Jenner, Rafter, and Halliwell 2005)	5
			—				1116 826 400 677		One free-living volunteer over four consecutive days. No increase on hydrolysis		
			—				4923 ± 1765 ^c 998 ± 758 ^c 4246 ± 1100 ^c 7150 ± 3376 ^c		(N=5, mean ± s.e.) Italy (N=5, mean ± s.e.) Germany (N=5, mean ± s.e.) Spain (N=5, mean ± s.e.) Denmark	(Knust et al. 2006)	20
			Two weeks				499 ± 288 ^b 690 ± 439 ^b		Low (poly)phenol diet four weeks Zero time (mean ± s.d., N=8) Four weeks (mean ± s.d., N=8)	(Munoz-Gonzalez et al. 2013)	41
			Two weeks				1184 ± 1037 ^b 1346 ± 1279 ^b		Red wine (ca 112 mg/250 ml) daily for four weeks Zero time (mean ± s.d., N=33) Four weeks (mean ± s.d., N=32)		
										16	472

Notes: a) described as fecal matrix and unclear precisely how it compares with fecal water as used by Jenner *et al.* and Karlsson *et al.*

b) $\mu\text{mol/g}$ rather than $\mu\text{mol/l}$ but authors do not indicate whether this is wet weight or dry weight

c) described as fecal matrix and unclear precisely how it compares with fecal water as used by Jenner *et al.* and Karlsson *et al.*

d) Phenolic content of baseline urine collected 12 h before orange juice intake used, on an excretion-per-hour basis, to subtract from excretion values in trained and detrained states obtained 0–24 h after supplementation to estimate increases in the phenolic content attributable to orange juice intake.

e) The participants consumed for breakfast for 3 days milled flaxseed (30 g/day), freeze-dried raspberry powder (40 g/day), and soy milk (250 mL/day), providing 300 mg/day of lignans (300 mg of secoisolariciresinol diglucoside), 150 mg/day of ellagitannins (118 mg of sanguin H6, 14.3 mg of lambertianin C, and other minor ellagitannins), and 22 mg of isoflavones/day (20.10 mg of daidzin and 1.8 mg of daidzein).

			Two weeks				31 ± 50 ^b 27 ± 33 ^b		Red wine (<i>ca</i> 112 mg/250 ml) daily for four weeks Zero time (mean ± s.d., <i>N</i> =31) Four weeks (mean ± s.d., <i>N</i> =31)		
										18	407

Notes: a) values were read from a graph and are approximate.

b) µmol/g rather than µmol/l but authors do not indicate whether this is wet weight or dry weight

c) Phenolic content of baseline urine collected 12 h before orange juice intake used, on an excretion-per-hour basis, to subtract from excretion values in trained and detrained states obtained 0–24 h after supplementation to estimate increases in the phenolic content attributable to orange juice intake.

Notes: a) collection of urine 48 hours rather than 24

b) collection of urine 12 hours rather than 24

c) Phenolic content of baseline urine collected 12 h before orange juice intake used, on an excretion-per-hour basis, to subtract from excretion values in trained and detrained states obtained 0–24 h after supplementation to estimate increases in the phenolic content attributable to orange juice intake.

d) $\mu\text{mol/g}$ rather than $\mu\text{mol/l}$ but authors do not indicate whether this is wet weight or dry weight

e) described as fecal matrix and unclear precisely how it compares with fecal water as used by Jenner *et al.* and Karlsson *et al.*

f) The participants consumed for breakfast for 3 days milled flaxseed (30 g/day), freeze-dried raspberry powder (40 g/day), and soy milk (250 mL/day), providing 300 mg/day of lignans (300 mg of secoisolariciresinol diglucoside), 150 mg/day of ellagitannins (118 mg of sanguin H6, 14.3 mg of lambertianin C, and other minor ellagitannins), and 22 mg of isoflavones/day (20.10 mg of daidzin and 1.8 mg of daidzein).

	0.006 (0.001, 0.013)	0.2 (0.04, 0.4)	24 hours	0.002 ± 0.001	spot	0.096 ± 0.012			Artichoke (5727 μmol) (N= 8, mean) (min, max)	(Dominguez-Fernandez et al. 2022)	8
										7	221

Notes: a) Phenolic content of baseline urine collected 12 h before orange juice intake used, on an excretion-per-hour basis, to subtract from excretion values in trained and detrained states obtained 0–24 h after supplementation to estimate increases in the phenolic content attributable to orange juice intake.

b) The participants consumed for breakfast for 3 days milled flaxseed (30 g/day), freeze-dried raspberry powder (40 g/day), and soy milk (250 mL/day), providing 300 mg/ day of lignans (300 mg of secoisolariciresinol diglucoside), 150 mg/ day of ellagitannins (118 mg of sanguin H6, 14.3 mg of lambertianin C, and other minor ellagitannins), and 22 mg of isoflavones/day (20.10 mg of daidzin and 1.8 mg of daidzein).
